# Using Github... *as a Lab*

(in between doing sciency things)

We often share code like this:

- This causes a few issues...

merge

fork, fetch upstream

fork

pull request

push

clone/
pull

add, commit

merge

fork, fetch upstream

fork

pull request

clone/pull

push

- A github repository is just a folder.
- Github tracks some of the contents of this folder.
- You can tell github which things in the folder to track.

- There is a GUI that allows you to make changes to the contents of the folder, and to share the folder with others.

- There is also a bash command line interface to do it.

add, commit
